IT GLIDES along slowly, showing off its glorious shades of blue and yellow and grey. This beauty is a chambered nautilus, which belongs to the marine family of cephalopods. It is one of four new species on display at Sentosa's Underwater World Singapore. The others are the mimic octopus, the giant Pacific octopus and the pharaoh cuttlefish. All are equipped with different abilities to camouflage themselves for survival. According to Dr Jeffrey Mahon, the attraction's curatorial director, cephalopods are regarded as the smartest form of invertebrate life.
